Task 1

On your Windows laptop or PC, open 'System Information' and take a screenshot showing your OS version, processor, and RAM details.

Answer

1. Press **Win + R**, type **msinfo32** and press Enter. (Alternatively click Start and type *System Information*.)
2. The *System Summary* page opens by default. Read the OS, processor and memory entries listed below.
3. Make sure these lines are all visible in the window without scrolling: *OS Name*, *Version*, *System Type*, *Processor* and *Installed Physical Memory (RAM)*. Enlarge the window if needed.
4. Press **Win + Shift + S** (Snipping Tool), drag around the window and save the image, or press **Alt + PrtScn** and paste it into Paint.
5. Save the screenshot as a PNG file and insert it in your report.

Detail	Where to find it in System Information	My value
OS version	OS Name and Version	**Windows 11 Pro** Version 10.0.26300 Build 26300
System type	System Type (64-bit or 32-bit)	**x64-based PC (64-bit)**
Processor	Processor (model, speed, cores)	**Intel Core i3-6006U @ 2.00 GHz** 2 Cores, 4 Logical Processors
RAM	Installed Physical Memory (RAM)	**8 GB RAM (LPDDR4)**

OS Name	Microsoft Windows 11 Pro

Task 2

Download any official Linux distribution ISO (like Ubuntu or Fedora), and use Rufus or BalenaEtcher to create a bootable USB drive for installation.

Hint: If you don't have a spare USB, use a virtual machine tool like VirtualBox to mount the ISO and start the installation process virtually.

Answer

Option A: Real bootable USB with Rufus

1. **Download the ISO** from the official site (ubuntu.com/download/desktop), choosing the latest LTS release. Optionally check its SHA256 checksum against the one on the site.
2. **Get a USB drive** of at least 8 GB. Back up its files first, because it will be erased.
3. **Download Rufus** from rufus.ie and run it (no installation needed).
4. In Rufus, choose your USB under *Device*, click *SELECT* and pick the Ubuntu ISO.
5. Keep *Partition scheme* as **GPT** (for modern UEFI PCs) or choose **MBR** for older BIOS PCs. Leave the file system as the default.
6. Click *START*, accept *Write in ISO Image mode* and confirm that data will be destroyed. Wait until the bar shows **READY**, then close Rufus.
7. **To use it:** restart the PC, press the boot-menu key (F12, F2, Esc or Del depending on brand) and choose the USB drive.

Option B: BalenaEtcher – open Etcher, click *Flash from file* and choose the ISO, click *Select target* and choose the USB, then click *Flash!*.

Option C: No USB, use VirtualBox

1. Install VirtualBox, click *New*, name the VM, set Type *Linux* and Version *Ubuntu (64-bit)*.
2. Give it 4 GB RAM, 2 CPUs and a 25 GB virtual disk.
3. Open *Settings* > *Storage*, click the empty optical drive, choose the ISO file, then click *Start* to begin the installer.

Tool	Purpose
Rufus / BalenaEtcher	Writes the ISO to a USB so it can boot
VirtualBox	Runs the ISO in a virtual machine without a USB

Task 3

On a macOS device (or using a macOS virtual machine), open 'System Preferences' and change the desktop wallpaper, then adjust the system language to Hindi or Gujarati.

Hint: Find 'Language & Region' in System Preferences to add or change languages.

Answer

On macOS Ventura (13) and later, System Preferences has been renamed **System Settings**; both paths are given.

Part 1: Change the desktop wallpaper

1. Click the **Apple menu** in the top-left corner and choose *System Settings* (older macOS: *System Preferences*).
2. Open *Wallpaper* (older macOS: *Desktop & Screen Saver* > *Desktop*).
3. Pick a picture from the Apple collections, or click *Add Photo* / the + button to choose your own image. The desktop changes immediately.
4. Close the window. Right-click the desktop to confirm the new wallpaper is showing.

Part 2: Change the system language to Hindi or Gujarati

1. Open *System Settings* > *General* > *Language & Region* (older macOS: *System Preferences* > *Language & Region*).
2. Under *Preferred Languages*, click the **+** button.
3. Search for and select **Hindi** or **Gujarati** and click *Add*.
4. When macOS asks which language to use as the primary language, choose *Use Hindi* / *Use Gujarati* (or drag it to the top of the list).
5. Click *Restart now* (or log out and in) so menus, Finder and apps appear in the new language.
6. **To switch back:** return to Language & Region, move English to the top of the list and restart.

Setting	Path (macOS Ventura and later)
Wallpaper	System Settings > Wallpaper
Language	System Settings > General > Language & Region

Task 4

Install a fresh copy of Ubuntu Linux (real or virtual machine) and create a new user account named 'gamer'. After installation, enable automatic login for this user and take a screenshot of the login screen showing the username.

Answer

1. **Boot the installer** from the USB or from the ISO in VirtualBox and choose *Install Ubuntu*.
2. Select the language and keyboard layout, connect to the network, and choose *Erase disk and install Ubuntu* (safe inside a virtual machine).
3. **Create the account:** enter your name, a computer name, **username: gamer** and a password, then continue.
4. Choose the time zone, review the summary, click *Install* and wait until it finishes. Restart and remove the USB or ISO when asked.
5. **Enable automatic login:** log in as **gamer**, open *Settings* > *System* > *Users* (older versions: *Settings* > *Users*), click *Unlock*, enter the password and switch **Automatic Login** ON.
6. **Take the login screenshot:** automatic login skips the login screen at start-up, so click the top-right menu and choose *Log Out*. The login screen now shows the user **gamer**. Capture it using the host's tool (VirtualBox: *View* > *Take Screenshot*, or Windows Win + Shift + S), because the in-session screenshot tool is not available there.
7. Log in again and restart once to confirm that it signs in as **gamer** automatically.

Check	Expected result
Username	gamer
Automatic Login	ON for gamer
Login screenshot	Shows the name gamer on the login screen

Screenshot: Ubuntu login screen showing 'gamer'

Task 5

> **Use ChatGPT to generate a step-by-step guide for installing Windows 10 on a laptop, including partitioning tips and post-installation settings for privacy and updates. Follow the guide and note any steps that were unclear or missing**

Answer

Prompt used: *"Write a step-by-step guide for installing Windows 10 on a laptop, including partitioning tips and post-installation settings for privacy and updates."*

Guide generated

1. **Check requirements:** 1 GHz CPU, 2 GB RAM (64-bit), 20 GB free storage, DirectX 9 graphics.
2. **Back up** your files to an external drive or cloud, and note your Wi-Fi password and licence details.
3. **Create installation media:** download Microsoft's Media Creation Tool and write the installer to an 8 GB USB.
4. **Boot from USB:** restart, press the boot-menu key (F2, F12, Esc or Del) and select the USB drive.
5. **Start setup:** choose language and keyboard, click *Install now*, enter the product key (or *I don't have a product key*), then pick *Custom: Install Windows only*.
6. **Partitioning tips:** select the correct disk; delete old partitions only if you want a clean wipe; select *Unallocated space* and click *Next* so Windows creates its own system partitions; use about 100 GB or more for C: and create a separate data drive afterwards in Disk Management; keep the manufacturer recovery partition unless you are sure.
7. **First-time setup:** choose region, network and a Microsoft or local account.
8. **Privacy settings:** turn off location, advertising ID, tailored experiences and inking/typing data; set diagnostic data to *Required*.
9. **Updates:** open Settings > Update & Security > Windows Update > *Check for updates*, install optional driver updates and set Active hours.
10. **Finish:** check Windows Security is on, create a restore point and install the manufacturer's drivers.

Review: steps that were unclear or missing

Step	Unclear or missing point
Overall	The guide did not say that Windows 10 passed its end of support on 14 October 2025, so security updates now depend on the Extended Security Updates programme; Windows 11 should be considered (check Microsoft's current ESU page for dates).
4	The boot-menu key differs by laptop brand; the guide did not say how to find it or how to change the boot order in BIOS/UEFI.
5	Unclear what to do about the product key and digital licence, and how to choose between Home and Pro.
6	Partition sizes were vague, drive names were not explained, and nothing was said about a drive not showing because of RAID/Intel RST mode (a storage driver may be needed).
7	Did not mention that the Wi-Fi driver may be missing during setup, so keep drivers on a USB or use a wired connection; the local-account option is not explained.
8-9	Menu names vary between builds and the exact path to each privacy setting was not given.
